

Fauna species recorded in the Metropolitan Melbourne Investigation area

As of October 2010, the Department of Sustainability and Environment's Atlas of Victorian Wildlife database contains records for the following taxa in the Metropolitan Melbourne Investigation area.

LEGEND:

EPBC: status under Commonwealth *Environment Protection and Biodiversity Conservation Act 1999*, as at January 2007.

EN Endangered: A taxon is endangered when it is not critically endangered but is facing a very high risk of extinction in the wild in the near future.

VU Vulnerable: A taxon is vulnerable when it is not critically endangered or endangered but is facing a high risk of extinction in the wild in the medium-term future.

Vic: conservation status in Victoria, after DSE (2007) and DSE (2009).

EX Extinct: when there is no reasonable doubt that the last individual has died. A taxon is presumed Extinct when exhaustive surveys in known and/or expected habitat, at appropriate times (diurnal, seasonal, annual), throughout its historic range have failed to record an individual. Surveys should be over a time frame appropriate to the taxon's life cycle and life form.

RX Regionally Extinct: As for Extinct but within a defined region that does not encompass the entire geographic range of the taxon—in this case Victoria. A taxon is presumed Regionally Extinct when exhaustive surveys in known and/or expected habitat, at appropriate times (diurnal, seasonal, annual), throughout the region have failed to record an individual. Surveys should be over a time frame appropriate to the taxon's life cycle and life form.

CR Critically Endangered: A taxon is Critically Endangered when the best available evidence indicates that it meets any of the criteria A to E for Critically Endangered (see Species Survival Commission 2001), and it is therefore considered to be facing an extremely high risk of extinction in the wild.

EN Endangered in Victoria: when the best available evidence indicates that the taxon meets any of the criteria A to E for Endangered (see Species Survival Commission 2001), and it is therefore considered to be facing a very high risk of extinction in the wild.

VU Vulnerable in Victoria: when the best available evidence indicates that the taxon meets any of the criteria A to E for Vulnerable (see Species Survival Commission 2001), and it is therefore considered to be facing a high risk of extinction in the wild.

NT Near Threatened: A taxon is Near Threatened when it has been evaluated against the criteria but does not qualify for Critically Endangered, Endangered, Vulnerable now, but is close to qualifying for, or is likely to qualify for a threatened category in the near future.

DD Data Deficient: A taxon is Data Deficient when there is inadequate information to make a direct, or indirect, assessment of its risk of extinction based on its distribution and/or population status. A taxon in this category may be well studied, and its biology well known, but appropriate data on abundance and/or distribution are lacking. Data Deficient is therefore not a category of threat. Listing of taxa in this category indicates that more information is required and acknowledges the possibility that future research will show that threatened classification is appropriate.

FFG: status under the Victorian *Flora and Fauna Guarantee Act 1988*, as at January 2007.
For the most up-to-date listings under the Act, visit: <http://www.dse.vic.gov.au>.

L – listed as threatened.

"Threatened and near-threatened species" refers to any taxon in this table with an "L" under FFG, or any category under "EPBC" or "Vic" (except Data Deficient species).

* denotes species exotic to Victoria

^ denotes species listed under the JAMBA agreement

∞ denotes species listed under the CAMBA agreement
